Turn On the Vigil Site

How to put the Vigil portal online when you need it, and take it offline afterwards.

Turn it on

1. Make sure your laptop is on, connected to the internet, and logged in.
2. Open this folder: `F:\Gitrepo\vigil mdr\tools`
3. Double-click `site-on.cmd`.
4. Wait for up to a minute until the black window shows `Vigil is ONLINE`, followed by an address ending in `trycloudflare.com`.
5. Copy that address into your browser.
6. Sign in with your portal password.
7. Press any key to close the black window. The site stays online.

> The address changes every time you turn the site on, so always copy the new one.

Turn it off

1. Open `F:\Gitrepo\vigil mdr\tools`.
2. Double-click `site-off.cmd`.
3. When it shows `Vigil is OFFLINE`, press any key.

Turn the site off when you finish, because it holds real hostnames, usernames, IP addresses and command lines.

What keeps running

The background job keeps collecting and analyzing detections while the site is off, as long as you're logged in. New incidents will be waiting when you turn the site back on.

If it doesn't work

Problem	What to do
`The tunnel did not start`	Check your internet connection, then double-click `site-on.cmd` again
The address shows an error	Wait 30 seconds and refresh. If it continues, run `site-off.cmd`, then `site-on.cmd`
Wrong password	Check Caps Lock, or set a new password using the steps below

Too many attempts	Wait 15 minutes, or run `site-off.cmd`, then `site-on.cmd`
Database offline	Log out and back in to Windows, or run `Start-ScheduledTask -TaskName 'Vigil PostgreSQL'`
Ollama offline	Start Ollama. New incidents wait until it's running

Forgot your password?

Your password can't be recovered, but you can set a new one. Open PowerShell and run:

```
cd "F:\Gitrepo\vigil mdr"
powershell.exe -NoProfile -ExecutionPolicy Bypass -File tools\set-portal-
password.ps1
```

Type a new password of at least 14 characters, twice. Nothing appears while you type. Then close that window, and double-click `site-off.cmd` followed by `site-on.cmd`.

Keep it safe

- Don't share your password or the live address with people who shouldn't see your data.
- Turn the site off when you aren't using it.
- Your laptop is the server, so the site stops if it sleeps or shuts down.
